

AI Research Agent — GitHub & Streamlit Deployment

GitHub upload

Create a public or private GitHub repository named ai-research-agent. Upload the generated project files while preserving the .streamlit/config.toml folder structure.

Do not upload

```
.streamlit/secrets.toml
.env
API keys
passwords
private tokens
```

Streamlit deployment

In Streamlit Community Cloud, create a new app from the GitHub repository. Select the main branch and app.py as the entry file. Use Python 3.12.

Secrets

```
GROQ_API_KEY = "YOUR_GROQ_API_KEY"
GROQ_MODEL = "openai/gpt-oss-120b"
```

After deployment

Open the app URL and test with a topic that has abundant public research. Confirm that sources appear, the report contains numbered references, and the source expanders show URLs and retrieved evidence.

If the app fails

First check Streamlit logs. Confirm GROQ_API_KEY is present, GROQ_MODEL is valid, requirements.txt is in the repository root, app.py is the selected main file, and Python is set to 3.12. If a web page is unavailable, the research pipeline should skip it rather than treat it as evidence.

Security check

If an API key is ever committed to GitHub, revoke/rotate it immediately at the provider and replace it in Streamlit Secrets. Do not simply delete it from the latest commit and assume it is safe.
